Conflict of Interest

- None

Summary

What is the main issue or key question(s) your work addresses?

- The monoclonal antibody (mAb) VRC07-523LS is safe and has potent neutralization activity against HIV. We assessed whether there are differences in pharmacokinetics (blood levels over time and distribution in the body) when given in combination with other mAbs.

What was the key finding or “take home message”?

- The pharmacokinetics of VRC07-523LS are largely unaltered in combination administration compared to alone.

How is this important for HIV vaccine research?

- VRC07-523LS has favorable PK and is a good candidate for combination bnAb regimens.

Background

Prior trials showed that VRC07-523LS alone or in combination with other bnAbs was:

- safe
- well-tolerated and
- has better PK and neutralization profile than VRCO1

Potential differences in PK of VRC07-523LS when given in combination vs. alone have not been formally assessed

Aim

- We performed a **cross-protocol analysis** integrating serum concentration data from 3 trials to compare the PK of VRC07-523LS when administered in combination with other mAbs vs. alone.
- We hypothesized that the overall PK profile of VRC07-523LS would be similar when administered in combination or alone.

Methods

- Retrospective cross-protocol analysis of the HVTN 127/HPTN 087, HVTN 130/HPTN 089 and HVTN 136/HPTN 092 studies
- Intravenous and subcutaneous administration included
- Serum concentrations of VRC07-523LS were described by an open two-compartment population PK model
- Participants divided into 2 groups based on combination or single VRC07-523LS administration
- Antibodies were administered sequentially
- PK parameters were compared using the targeted maximum likelihood estimation (TMLE) method to adjust for potential differences in baseline covariates between groups

VRC07-523LS PK parameters similar with combo and alone

Similar concentration over time from combination and single administration VRC07-523LS

Predicted concentrations at:	Single: Mean (95% CI) (N=100)	Combination: (95% CI) (N=46)	Combination/Single: Ratio (95% CI)	Two-sided raw p-value	Two-sided adjusted p-value
1 day post 1.4g IV infusion (mcg/ml)	332.68 (299.8, 369.17)	271.34 (244.02, 301.71)	0.82 (0.75, 0.88)	<0.001	<0.001
4-Week post 1.4g IV infusion (mcg/ml)	103.99 (98.15, 110.18)	94.28 (89.34, 99.49)	0.91 (0.86, 0.96)	<0.001	0.00
8-Week post 1.4g IV infusion (mcg/ml)	66.73 (62.81, 70.89)	61.75 (58.02, 65.71)	0.93 (0.87, 0.99)	0.02	0.09
16-Week post 1.4g IV infusion (mcg/ml)	29.06 (26.96, 31.33)	28.86 (26.78, 31.11)	0.99 (0.91, 1.08)	0.88	1.00

Vc and Vp were higher in combination administration via the TMLE method

PK Features	Description	Single: Mean (95% CI) (N=100)	Combination: (95% CI) (N=46)	Combination/Single: Ratio (95% CI)	Two-sided raw p-value	Two-sided adjusted p-value
CL (L/day)	Clearance from the central compartment	0.12(0.11, 0.13)	0.13 (0.12, 0.13)	1.06 (1.00, 1.13)	0.06	0.17
Vc (L)	Volume of the central compartment	3.74 (3.26, 4.29)	4.66 (4.07, 5.34)	1.25 (1.14, 1.37)	<0.001	<0.001
Q (L/day)	Inter-compartmental distribution clearance	0.30 (0.22, 0.41)	0.30 (0.22, 0.41)	1.00 (0.91, 1.11)	0.97	0.97
Vp (L)	Volume of the peripheral compartment	3.51 (3.07, 4.01)	3.89 (3.45, 4.38)	1.11 (1.04, 1.18)	<0.001	0.01

Elimination half-life was higher in combination admin via the TMLE method

PK Features	Description	Single: Mean (95% CI) (N=100)	Combination: (95% CI) (N=46)	Combination/Sin- gle: Ratio (95% CI)	Two-sided raw p-value	Two-sided adjusted p-value
Distribution half-life (day)	Length of time for serum concentration of the mAb to decrease by half in the distribution phase	3.71 (2.75, 5.01)	4.23 (3.15, 5.69)	1.11 (1.05, 1.17)	0.01	0.06
Elimination half-life (day)	Length of time for serum concentration of the mAb to decrease by half in the elimination phase	47.67 (45.46, 49.98)	52.84 (50.17, 55.66)	1.11 (1.05, 1.17)	<0.001	0.00
Dose normalized steady-state AUC (day/L)	Dose-normalized area under the curve assuming a single IV administration	8.42 (7.96, 8.9)	7.94 (7.52, 8.39)	0.94 (0.89, 1)	0.06	0.17

Discussion

- Most PK parameters did not differ significantly between combination and single groups
- Mean elimination half-life was slightly longer for combination vs. single administration
- Mean covariate-adjusted central volume of distribution (V_c) and peripheral volume of distribution (V_p) were slightly larger for combination vs. single administration, respectively
- Overall exposure/concentration over time was comparable between group

These results support the design of combination bnAb trials
